

What is the QFS?

Contrary to what a number of individuals understand, the QFS (Quantum Financial System) is NOT a bank account. It is a way to track, transfer, and protect money—not a storage tank.

But how did the QFS begin? Basically, it was born out of the awareness aware of the inefficiencies and corruptibility of the current financial system. Several individuals united to address these issues by advancing financial technology using quantum computation and distributed ledgers. As part of this system, all your tangible assets such as gold, oil, platinum, etc., (not fiat paper money) can be tracked. All sovereign currencies are secured by gold or other assets. Transactions will be processed via the QFS VPN, which can be used for purchasing any product or service. Its main characteristics include:

- A universal network to facilitate the transfer of asset-backed funds.
- Protection for all parties involved against corruption and manipulation at the banking system level.
- Monitoring and protection for banks.
- An independent system not dependent on the existing centralized system.

In addition, the QFS can virtually eliminate nefarious transactions—stopping them in their tracks. It is also heavily secured by Secret Space Programs (SSP), providing the highest level of security.
